SN

This is an axial PET scan of a human brain. The image shows a cross-section of the brain with a color scale where blue represents low uptake and yellow/green represents high uptake. A prominent focal area of increased uptake is visible in the left hemisphere, located in the upper-middle portion of the image. The rest of the brain shows relatively uniform, low-level uptake. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the level of the focal lesion.
