MD

This is a coronal brain MRI scan. The image shows a cross-section of the brain with a central vertical line representing the midline. The left hemisphere (viewer's right) appears mostly normal with uniform gray matter. The right hemisphere (viewer's left) shows a large, irregularly shaped area of hyperintensity (brighter) in the posterior region, extending from the occipital lobe towards the parietal lobe. This area has a mottled texture with varying shades of gray and white, suggesting a complex lesion. A small, bright white spot is visible at the very posterior tip of this lesion. The rest of the brain tissue shows typical anatomical structures with varying intensities.
