SN

This is an axial brain scan image, likely a PET or SPECT scan, showing a cross-section of the brain. The image is predominantly dark blue, indicating low signal intensity. There are several areas of increased signal, shown in lighter blue and cyan. A prominent focal area of high signal is located in the upper left quadrant of the image, corresponding to the left hemisphere of the brain. Other smaller areas of increased signal are visible in the upper right and lower central regions. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the focal area of high signal.
