This is an axial brain scan image, likely a PET or SPECT scan, showing a cross-section of the brain. The image is predominantly blue, indicating low activity. A prominent focal area of high activity is visible in the upper-left quadrant, colored in a gradient from yellow to red. A smaller, less intense blue spot is located in the lower-left quadrant. The brain's anatomical structure is visible as a dark silhouette against the lighter background. A white crosshair is overlaid on the image, with a vertical line passing through the center of the high-activity region and a horizontal line passing through the lower part of the brain.
