MD

This is a brain MRI scan, likely a T2-weighted or FLAIR sequence, showing a cross-section of the brain. The image is divided into four quadrants by a vertical and a horizontal white line. The brain tissue is primarily blue, indicating low signal intensity. A prominent, bright, yellowish-white focal lesion is visible in the lower-left quadrant, which corresponds to the posterior region of the left hemisphere. The lesion has a somewhat irregular, elongated shape. The surrounding brain tissue appears relatively normal, with some minor signal variations. The overall image quality is somewhat grainy, typical of MRI scans.
