VPM/VPL

An axial brain scan showing a blue-colored region of activation. The image is divided into four quadrants by a vertical and a horizontal white line. The blue region is located in the left hemisphere, primarily in the posterior and lateral areas, consistent with the VPM/VPL (ventral posterior medial/lateral) somatosensory cortex. There are two distinct blue spots: one larger spot in the lateral posterior region and one smaller spot in the medial posterior region near the midline.
