CA1

An axial brain scan image showing a cross-section of the brain. The image is predominantly black, with a central vertical strip of blue highlighting a specific region. This blue region is wider at the top and tapers towards the bottom, following the shape of the brain's midline structures. The blue area is centered on the midline and extends laterally into the hemispheres. The overall appearance is that of a functional or structural brain scan, possibly an fMRI or PET scan, where the blue color indicates areas of increased activity or metabolic rate. The image is divided into four quadrants by a vertical and a horizontal white line.
